One or more positively-charged As in the heparin-binding domain (AAs 128-138) are replaced by neutral or negatively-charged residues as indicated in the feature table. A recombinant vector (pUG9-TSF1) or pUG9delH3-pTSF-3) contg. the mutated DNA can be used to transform bacterial or mammalian host cells for prodn. of the analogue.

                  The peptide sequence was deduced from the synthetic DNA sequence prepd. as described in EP-363675. E. coli cells transformed with synthetic DNA were lysed and the supernatent purified, giving a synthetic DNA were lysed and the supernatent purified, giving a synthetic DNA were lysed and the supernatent purified, giving a solution of the amino acid

An adduct of bFGF formed with heparin or heperan sulphate contg. the bFGF 9-10 Leu-Pro bond can be cleaved with pepsin A or cathepsin D to cleave this bond and release a peptide with the N-terminus be deleted up to and including residue 9, sequentially. This cleavage method can be used to obtain a pure form of the 146 amino acid bFGF (10-155) bFGF. The prod. can be used to treat wounds and burns.
                                                                                                                     Synthetic functional polypeptide to promote wound contg. cell adhesion polypeptide from fibronectin growth factor polypeptide, opt. linked by spacer

                                        proteins are useful for targetting saporin (a cytotoxin) to a cell carrying the FGF receptor. Targetted agents (TA) other than saporin which may be used include in partic. DNA encoding a therapeutic protein, antisense DNA or other cytotoxic agent. The linker sequence within the fusion protein may increases serum stability or intracellular availability of the TA. The conjugates of the invention are used to inhibit cell proliferation in cells carrying the particular growth factor receptor; also when TA is DNA it can be used to deliver this to cells (for gene therapy). A specific application is to prevent excessive proliferation of epithelial cells, fibroblasts and keratinocytes in the anterior eye after surgery, partic, to prevent recurrence of pterygii after surgery are moved. Closure of the target of the surgery are moved.
trabeculectomy after glaucoma surgery and corneal clouding after excimer laser treatment. Other conditions which may be treated in tumours, restenosis, psoriasis, Dupuytren's contracture, diabetic
                                                                                                                                                                                                                AAR80776-84 are fibroblast growth factors (FGF) FGF-1 to rur-y respectively. DNA encoding these fibroblast growth factors can be used to create an FGF/saporin fusion protein. DNA encoding such fu
                                                                                                                                                                                                                                                                                                                         New conjugates of growth factor receptor ligand and targetted agent - partic. DNA or cytotoxin, used to control cell proliferation in the eye, e.g. to prevent growth of pterygii and corneal clouding

                                                                                                                                                                                                                                                              The present sequence is a human fibronectin amino-terminal oligopeptide, which was used in the development of a novel method for increasing the efficiency of gene introduction into a target cell using a retroviral vector. The method comprises carrying out viral infection of the target cell in the presence of a retrovirus and target cell binding substance or substances. The method can be used to effectively introduce genes into target cells for the gene therapy of cancer and viral diseases, e.g. AIDS.
                                                                                                                                                                                                                                                                                                                                                                                                      Method for increasing efficacy of gene transfer to target cell using retrovirus - by infection of the target cell in the presence of a substance which binds to the virus and a substance which binds to the target cell

                                                                                                                                                                                                       AAW19595 is a biologically active recombinant human basic fibroblast growth factor (bFGF). The protein is free from all infectious impurities, substances that normally accompany it and from post-translational modification of Cys residues of native human bFGF. Recombinant bFGF is used to promote healing of wounds, bone fractures, damaged myocardial tissue etc. and, since it increases neuronal survival and promotes neurite outgrowth, may also be used in treatment of neurological disorders such as Alzheimer's and Parkinson's diseases. bFGF may also be used for detection of specific inhibitors; for treatment of cell cultures in vitro before transplant and for inducing release of tissue plasminogen activator or collagenase, e.g. for treatment of a chronic tendency to form embolism. Recombinant bFGF can be produced on a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Key

The method is for the control of humannodeficiency virus (HIV) infection using a composition which comprises a functional substance which participates in the infect HIV. The method is used to control HIV-infection.

This is the amino acid sequence of fibroblast growth factor-2 (FGF-2), or basic fibroblast growth factor (bFGF). Claimed DNA molecules of the invention encode FGF mutein polypeptides (see AAW75711-20) that show reduced FGF receptor binding activity but which retain the ability to bind heparin. For FGF-2, amino acid
                                   Cys-78 and Cys-96 residues to reduce aggregation. The mutein is obtained by site-specific or site-directed mutagenesis of FGF-2 DNA, incorporation of the mutated DNA into a vector and expression in host cells. The FGF muteins are used to treat heparin-related disorders, such as excessive bleeding induced by heparin, ophthalmic disorders and heparin-associated thrombocytopenia and thrombosis. They may also be used for drug design, especially
                                                                                                                                which retain the ability to bind heparin. For FGF-2, amino acid residues 95, 101 or 104 are preferably replaced by other amino acid residues, with an optional further replacement of the Glu-96 residue. The mutein may be further modified by replacement of the
                                                                                                                                                                                                                                                               Disclosure; Page 53; 71pp; English.
                                                                                                                                                                                                                                                                                            Fibroblast growth factor mutein and DNA - having reduced receptor binding and able to bind heparin, useful for treating and regulating heparin-related disorders e.g. thrombosis

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Best Local Similarity Matches 155; Conserv
                                                                               (FGF-2), a leaderless protein. A leaderless protein refers to a protein that is found in an extracellular environment, but lacks a canonical leader sequence. The specification describes a method for inhibiting export of a leaderless protein from a cell. The method comprises treating the cell with an agent that inhibits binding between the leaderless protein and a transport molecule. Treatment with the inhibiting agent is specifically used to treat angiogenesis and restenosis, i.e. where expression of FGF-2 is inhibited, and the agent is applied to endothelial or smooth muscle cells. Other applications are treatment of tumours
                                                                                                                                                                                                                                                                                         Inhibiting export of leaderless protein with agent that inhibits binding to transporter protein - especially for treating angiogenesis and restenosis by preventing export of fibroblast growth factor, also methods for identifying leaderless proteins.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  export; angiogenesis; restenosis; treatment; timour; cell proliferation; diabetes; retinopathy; infection; polycystic kidney disease; atherosclerosis.

                                                                                                                                        Fibroblast growth factor (FGF) proteins (AAW53022-W53024 and AAW53029-W53033) are members of the fibroblast growth factor family and have homology to Fibroblast growth factor homologous factor (FHF) proteins. The FHF proteins (FHF 1-4) are involved in regulating the growth, survival, and differentiation of cells in the central nervous system, as well as cells in peripheral nervous tissues. The proteins creating and diagnosing conditions involving the nervous system. FHF's can also be used in methods for maintaining cultured cells or tissues or to promote neuron growth in vitro.
                                                                                                                                                                                                                                                                                      New fibroblast growth factor homologous factors - useful for, e.g. developing products for diagnosis and treatment of conditions involving neuro-degenerative and neoplastic disorders
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            14-AUG-1998

                                                                                                                      including inhibiting nuclear localisation, modulating protein trafficking of nuclear proteins such as FGF (in vitro or in vivo), identifying further trafficking components, and treating a variety of conditions associated with nuclear trafficking. The 24, 23 and 22 kD isoforms of FGF2 are nuclear proteins whereas the 18 kD isoform is not but is secreted. Inhibiting the nuclear transport of FGF-2 allows the control of undesired proliferation and inflammation, particularly tumour growth. Increasing export of FGF can promote angiogenesis. In addition, use of inhibitors of nuclear localisation can limit or eradicate viral (e.g. HIV
                                                                                                                                                                                                                                                                                                   This sequence represents the 18 kD isoform of the human fibroblast growth factor 2 (FGF2). The invention relates to inhibiting nuclear localisation of a nuclear protein in a cell, by administering an inhibitor of nuclear
                                                                                                                                                                                                                                                                                                                                                                                                Inhibiting nuclear localisation of proteins - used for controlling cellular functions, e.g. undesired proliferation and inflammation, particularly tumours, and treating viral infection
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Human; fibroblast growth factor; translational start site; isoform; inhibition; nuclear localisation; nuclear trafficking component; proliferation; inflammation; tumour growth; angiogenesis.

acidic fibroblast growth factor - golden hamster
N;Alternate names: heparin-binding growth factor 1
C;Species: Mesocricetus auratus (golden hamster)
C;Acces: 10-Sep-1999 #sequence_revision 10-Sep-1999 #text_change 10-Sep-1999
C;Accession: A60721
R;Hall, J-A.; Harris, M.A.; Malark, M.; Mansson, P.E.; Zhou, H.; Harris, S.E.
J. Cell. Biochem. 43, 17-26, 1990
A;Title: Characterization of the hamster DDT-1 cell aFGF/HGBF-I gene and cDNA an A;Reference number: A60721; MUID:90270291
A;Accession: A60721
A;Status: not compared with conceptual translation
A;Residues: 1-155 cHAL>
C;Repwords: growth factor; heparin binding
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        basic fibroblast growth factor precursor, 25K-c; Species: Cavia porcellus (guinea pig) C; Date: 20-Oct-1989 #sequence_revision 20-Oct-19 C; Accession: A32484
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              RESULT

acidic fibroblast growth factor 1 precursor [validated] - human
N; Alternate names: beta ECGF; endothelial cell growth factor beta; heparin-binding growt
C; Species: Homo sapiens (man)
C; Date: 10-Sep-1999 #sequence_revision 10-Sep-1999 #text_change 08-Dec-2000
C; Accession: A33665; A33316; S18217; A44804; A24662; H90707; S35535; S35536; I39413; A23
R; Mergia, A.; Tischer, E.; Graves, D.; Tumolo, A.; Miller, J.; Gospodarowicz, D.; Abraha
Biochem. Biophys. Res. Commun. 164, 1121-1129, 1989
A; Title: Structural analysis of the gene for human acidic fibroblast growth factor.
A; Reference number: A33665; MUID:90073637
A; Accession: A3365
A; Molecule type: DNA
A; Residues: 1-155 CMERD
A; Colle type: DNA
A; Residues: 1-155 CMERD
A; Coll. Biol. 9, 2387-2395, 1989
A; Title: Cloning of the gene coding for human class 1 heparin-binding growth factor and

OM protein - protein search, using sw model

Run on: June 7, 2002, 14:46:42; Search time 23.13 Seconds (without alignments)
259.470 Million cell updates/sec

Title: US-09-802-365-8
Sequence: 826
Sequence: 1 MAAGSITTLPALPEDGGSGA......GSKTGPGQKAILFLPMSAKS 155

Scoring table: BLOSUM62
Gapop 10.0, Gapext 0.5

Searched: 105224 seqs, 38719550 residues

Total number of hits satisfying chosen parameters: 105224
Minimum DB seq length: 0
Maximum DB seq length: 2000000000
```

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Post-processing: Minimum Match 0% Maximum Match 100% Listing first 45 summaries
